Saltpetre

for the 21st century

ZENFERT® 24 N is a surface-treated, granulated nitrogen fertiliser with a notable content of finely ground zeolite that gives the fertiliser unique properties.

It is a reliable, universal nitrogen fertiliser with a balanced nitrate-to-ammonium nitrogen ratio, which will find its application in almost any culture. The fertiliser can be applied either before the setting of the crop or for additional fertilisation throughout the entire vegetation period.

Zeolite positively influences the physicochemical properties of soils, especially when re-applied over the long term.

- ✓ Regulates the water regimen in the soil profile and increases the use of water by plants
- ✓ Binds nutrients that are gradually released for plant needs throughout the entire growing season
- ✓ Reduces nitrogen losses to groundwater and to the atmosphere, increasing the use of nitrogen by plants
- ✓ Promotes improved soil structure
- ✓ Positively influences crop growth and development, increases yield and improves production quality
